

Supplementary Figure S6: ALDEx3 returns a tighter distribution of minimum log-difference values required for significance across all datasets. For each of the 100 iterations of the given dataset, the minimum absolute difference between groups needed for a gene to be reported as differentially expressed by ALDEx2 and ALDEx3 was recorded, based on a BH-adjusted P -value of <0.05 , for γ values ranging from 0 to 0.5. Data for the Cancer Genome Atlas (TCGA), vaginal metatranscriptome, single-cell, 16S rRNA amplicon, and yeast transcriptome datasets are expressed as density plots and coloured by tool and γ value. Values for TCGA datasets represent an aggregate across the individual tumour transcriptome datasets. Dashed lines indicate the mean value.
